Works for me. They have to follow Joe's instructions to mark the run as fixed. Or email me if they forget so we can fix it on the reporting side.

Eric would prefer we condense everything to the 1 VM and survey controller project ID.

That will work, but just remind them when starting a run to mark an instrument as fixed in the run creation wizard. Previously we had left it as mobile and just assumed it was more or less staying in the same area.

and to back up even further...

the original reason we had this running on 2 VMs was to keep the tasks separate and so the field would be allowed a hands off approach to managing the runs. Considering that both of those things seem to no longer be true you could just condense everything to 1 VM and thus 1 Survey controller project ID.

Union the 2 sets together and use the IsFixedLocation in ReducedSensorData table to differentiate between fixed and mobile? We can have IsFixedLocation updated based on run id.
Thoughts?

Eric.

We are having a hard time deciphering the data. If you look at deployment manager all previous mobile runs went to PID 1627 (which we have the mapping views and mobile reports running from). Joe had set up the fixed locations to come through to PID 1628 so we were going to set up other mapping and reporting views for fixed from there.

So essentially 1628 and 1627 are 2 different scribe dbs and our plan was to have the mobile reports and mapping run off of 1627 and the fixed locations run off of 1628 because they are 2 different reports.

Since they seem to be getting mixed now we need some time to see how we are going to do this on the database side if possible you will also see below that it looks like there were 2 mobile runs that went to 1628.

Joe, Melissa, Kris any ideas on how to make this easier with what we have now?

Then there is 1629 - CTEH data which is not yet coming through unless you need us to report on?
